between the remote and your MacBook's infrared sensor. If giving presentations is one of your primary duties, Targus's Bluetooth Presenter is a more-capable alternative to Apple's Remote. At 5.1 inches long, 1.7 inches wide, and 1 inch thick, the Presenter is chunky, but that size makes it large enough to feel solid in your hand, but small enough that even those with small hands should be able to hold and use the Presenter comfortably. The sides and bottom of the Presenter are covered in matte plastic that offers a bit more grip than the glossy finish of Apple's Remote, and at just under 4 ounces, the Presenter feels considerably heftier without adding much weight to your laptop bag.

The Presenter, a Mac-only product that's part of the line, uses Bluetooth wireless instead of infrared, which means better range without requiring a direct line of sight; you can use the Presenter from up to 33 feet (10 meters) away from your Mac, even if there are objects in between. Pairing the remote with your Mac is a simple, one-time process, much like the one you'd use to pair a Bluetooth mouse. Targus claims the Presenter will get up to six months of use from two AA batteries. (I haven't used the Presenter long enough to test that claim.) The Presenter offers considerably more functionality than Apple's Remote, split between two modes: Presenter and Mouse. You switch between these modes using a slider switch on the face of the remote. In addition to this slider, the remote hosts a circular button surrounded by two large arrow buttons, left and right; and two smaller buttons near the top edge. A rocker switch on the right-hand side lets you adjust your Mac's volume level, and there's a power button on the left. In Presenter mode, the large arrow buttons let you move forward or back in your presentation; the smaller button on the right starts your presentation; and the smaller button on the left blanks the screen during the presentation. Mouse Targus Bluetooth For Macbook Pro The circular button activates the Presenter's built-in laser pointer. In Mouse mode, the left arrow button acts as a standard mouse click; the right arrow button acts as a control/right-click; and the circular button becomes a touch-sensitive control pad that lets you move your mouse cursor around your Mac's screen-sort of like a tiny trackpad. (Targus calls this optical touch pad the Touch Scroll.) In Mouse mode, the two smaller buttons are programmable using Targus's downloadable Mac driver, currently at version 1.0.0b1. (I found that all features except the programmable buttons worked without the driver installed.) The Presenter's Mouse mode worked better than I expected; I was able to control my MacBook's mouse cursor adequately, despite the small size—less than half an inch across—of the sensor. However, you definitely lose accuracy compared to a mouse or the laptop's built-in trackpad, and because the Touch Scroll is so small, it takes several swipes to move your cursor from one side of the screen to the other. In other words, you won't want to use the Presenter as your primary input device; it's for occasionally controlling your cursor during presentations. Targus's driver is technically still beta software right now, but it worked well during my testing. Using a new Targus pane in System Preferences, you can choose whether the Presenter's two programmable buttons are configured for Keynote or PowerPoint (the two programs use different control schemes), and you can also choose custom actions for those buttons when the Presenter is in Mouse mode. Available actions include launching an application, performing a keystroke, running an AppleScript, as well as a number of predefined functions. Targus Bluetooth Mouse Setup Those functions include eject, print screen, select all, volume up or down, mute, Expose actions, Dashboard, play/pause iTunes, and back or forward in Firefox. Unfortunately, you can't choose different actions for different programs; you get only a single custom action per button. For a configuration example, I set the left programmable button to perform the keystroke Command+H in Mouse mode, setting the right programmable button to launch Keynote. With these settings, if I need to do a live demo during a presentation, I just flip to Mouse mode and press the left programmable button to hide Keynote; when I'm done, I press the right programmable button to switch back to Keynote, right where I left off. Mouse Targus Bluetooth For Mac Pro The Targus software's interface is somewhat confusing. When I first attempted to configure the Presenter, I interpreted the interface, shown at right, as letting you choose different custom button settings for Keynote and PowerPoint. However, these settings are independent: first you choose which presentation software you use, which determines the behavior of the various buttons in Presenter mode; then you configure the custom button settings for Mouse mode. The Presenter isn't the most-configurable presentation remote I've seen, but it offers a good deal of functionality while keeping the number of buttons to a minimum. (Some remotes offer so many buttons that it's difficult to keep track of which is which—not good when giving an important presentation.) In addition, the buttons the Presenter does provide are shaped obviously and arranged intuitively: it's easy to use the remote by feel without having to worry that you're going to accidentally press the wrong button. It's not an inexpensive accessory, but if you're a Keynote or PowerPoint pro, it's definitely worth checking out. This story, "Targus Bluetooth Presenter" was originally published. Page 9 Wikileaks On Twitter McAfee Releases Detection Tool For MacIntel Security (McAfee) Releases Rootkit Scanner Following Vault 7 CIA Leak Intel Security, soon to be rebranded as McAfee again, released on Wednesday a scanner that, WikiLeaks released the first batch from the Vault 7 project in March, containing a total of 8,761 documents. Some of the latest releases were dedicated to a CIA project targeting SMS messages sent and receive on Android devices and to CIA tools for stealthy hacking of Apple's operating system. The MNE for Mac Remote Provisioning Tool, requires a system restart before being able to communicate with the ePO server. McAfee Management of Native Encryption (MNE) 4.1.1.x and earlier releases McAfee ePO Remote Provisioning Tool Mac FileVault For details of MNE supported environments, see KB-79375. Wikileaks On Twitter McAfee Releases Detection Tool For Mac The latest revelations about the U.S. Government's powerful hacking tools potentially takes surveillance right into the homes and hip pockets of billions of users worldwide, showing how a remarkable variety of everyday devices can be turned to spy on their owners. Televisions, smartphones and even anti-virus software are all vulnerable to CIA hacking, according to the WikiLeaks documents released Tuesday. The capabilities described include recording the sounds, images and the private text messages of users, even when they resort to encrypted apps to communicate. While many of the attack technologies had been previously discussed at cybersecurity conferences, experts were startled to see evidence that the CIA had turned so many theoretical vulnerabilities into functioning attack tools against staples of modern life. These include widely used Internet routers, smartphones, and Mac and Windows computers.
